

# Day Two

## Conditionals and Color

# Today's Plan

Learn about conditional statements

Learn to use the color sensor

# Simon Says

Did you notice any patterns?

What format were the statements?

What were the possible answers to the questions?

# What are Boolean Expressions?

- Yesterday we learned about boolean variables (they are always True or False)
- Boolean expressions are statements that *evaluate* to True or False (a boolean value)

When comparing values, we use double equal signs (==) to differentiate from the assignment operator (=)

3 > 2

True

4 == 2.5 →

False

10 < 6

False

# Variables in Boolean Expressions

Variables can be used in boolean expressions!

For example,

```
x = 4
```

```
False
```

```
x < 3
```

```
y = 15
```

```
True
```

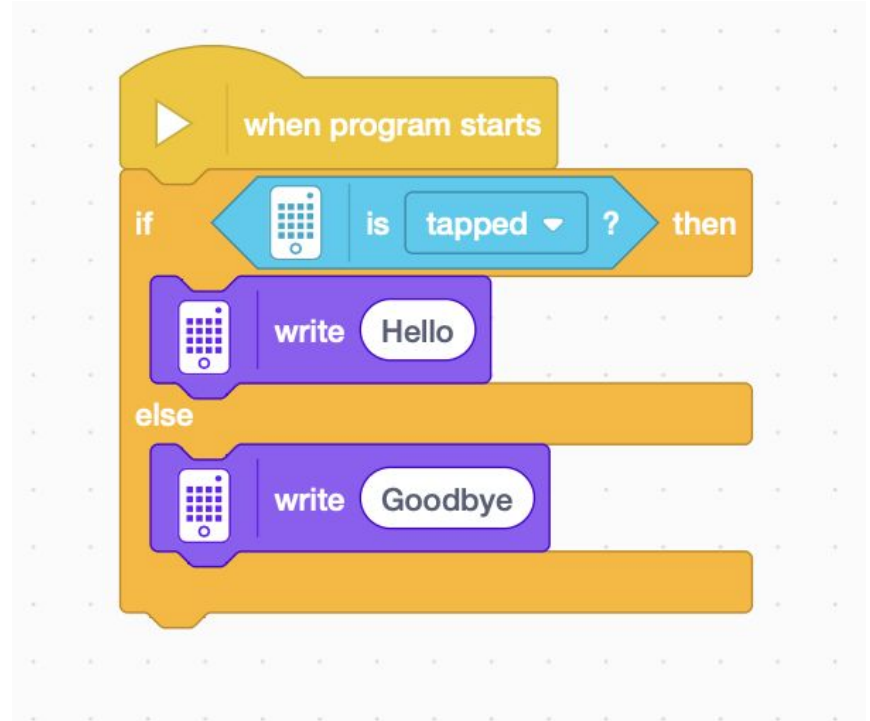

```
y == 15
```

# Conditionals

- Conditionals occur in programming when we decide to do an action depending on whether or not a boolean expression is True or False
- For example, if  $3 > 1.5$ , dance!
- Otherwise, sit quietly.

# Conditionals in our Robots

- Conditionals are represented using orange blocks in Spike
- if some condition is true (blue block) then do some action (purple block)
- else do some other action
- The else runs automatically if the condition specified in the if is False
- Conditions (blue blocks) are boolean—they are always either True or False

# Reacting to the Environment

Conditionals are often used with environmental events

- if it is raining, bring an umbrella
- if it is sunny, wear sunscreen
- if it is cold, wear a jacket. else wear a tshirt

Our robots can sense certain aspects of the environment, too!

- Color
- Light
- Distance
- Touch

# Color Sensor!

Track what color the sensor sees with the live monitor at the top of your screen!

these are the color options

this means no SINGLE color is seen

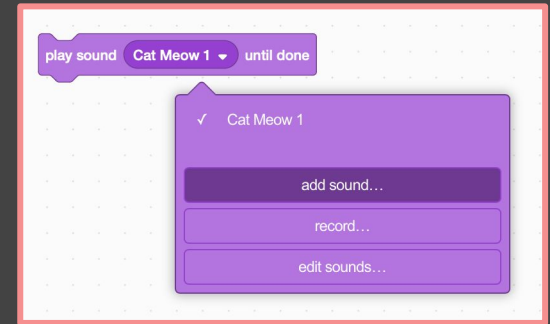

# Pre-Lab

Find and attach the color sensor to the hub. Using the if or the if/else block, write a program that identifies a color by speaking the color or displaying it on the hub! How many colors can it identify from the lego kit?

You can choose sounds from a library or record your own!

# Lab: McSortie

Today we will be building a color sorter! Your task is to build McSortie, who can sort lego pieces by their color.

# Lab Hints

McSortie can be extended to use more sensors or even sort more colors!  
Can you extend its functionality?
